# Reflection

Trouble spots I find myself encountering are the connection of the different components and the method errors I receive from time to time within my functions. It can be a little frustrating when you think you've found a solution and then you go to a different component page to add code and it breaks the previous one. It helps that React will literally blast the error across the browser so you can search the error. Nine times out of ten someone else has encountered the issue as well and other members of the development community will have provided multiple ways of handling the error depending on your approach.

If I could go back and give myself advice, I'd definitely tell myself to try and find outside resources/help groups (live ones as well) to bounce questions off of and get help with assignments and understanding the new weekly concepts. I think that was one of the harder things with this module. At times it felt overwhelming when I was reviewing the LearnIts and reading the weekly excerpts and scrolling through the online library and it felt as though nothing was clicking. And because of my schedule I could never really hop in any study groups besides Sundays (and the Saturday morning classes) and try to cram every possible question in that I couldn't find an answer for searching the web or watching videos on Youtube.

Learning react itself was an accomplishment itself. I've heard a few negative reviews about react and how difficult it could be. Yes it was a learning curve with setting up different components and trying to keep everything organized, but I enjoyed each week in the course and the assignments definitely exercised the try harder muscle before asking for help.
